

Daniel J. Mueller

Danieljmueller@outlook.com - (309)202-0403

Daniel Mueller - Developer and theoretical physicist. I draft projects and prototype novel concepts rapidly. I am an asset who can do many things.

Untitled-7

This is a new company I spun up to experiment with various sites and concepts. It is also a mechanism for me to handle freelance client work apart from Galacto. I own the 20+ best domains for untitled-7 such as .com, .net, .app, .dev, .co, etc. I'm evaluating the future direction of it, and waiting to make moves.

Galacto

I am the president of this company. We make algorithms for various sequence analysis applications ranging from genomics, text compression, artificially intelligent text processors, and logical inference. We have filed multiple patents, and are presently dormant to manage overhead while waiting for responses.

Rivian

I was a battery test technician here, handling battery fault diagnostics for 3 months. I handled a large project which involved pack failure investigation and reporting, and also managed inventory for client packs while communicating with production. Formal writeups here were routine.

Morton Industries

I was an engineer responsible for incoming stock tube feature lasering and cutting prior to bending, welding, and painting down the line. My shift was the weekend shift, where I worked alone with my supervisor. It was 3 12 hour shifts a week, and I pushed major production there. I ran an LT Fiber Evo, and expedited production through Kaizen/LEAN improvements, while reducing part waste. I did this by entering 50+ orders at once, which enabled maximal stock utilization with minimal waste. I would prep 8 rows of 4 crates instead of using only 3 at a time like other shifts.

Twin Image

I was an executive assistant to twins who had dozens of high profile contracts with companies like Ball, Rubbermade, and many others. I would do engineering work, fix equipment, various renovations, and handle online sales.

Corbion

I was trained here to perform sterile techniques. I never contaminated any vessels throughout my time here, and led several projects. Corbion was a relatively new startup at that time, only a couple years old, and my level of autonomy was appropriate for that. I got my hands dirty. UHPLC, plating, incubation, autoclaving, inoculating vessels, bioreactors, and stand up meetings were routine.

The Wassi Group

Architectural Laser Scanning for various outbound clients. I was trusted to show up at various clients locations with \$20,000+ worth of scanning equipment and perform my tasks reliably. I made lots of friends and had good rapport. I was also a printshop manager for site plans, and handled printing, plan binding, file conversion, ink replacement, roll stocking, spec book binding, and delivery.
